### Tech Stack

- **Code** Python, Spark, SQL / NoSQL, Scala, Go
  - **DevOps** Git, Docker, Ansible, Airflow, NGINX, Terraform
  - **AWS** EC2, S3, EMR, Glue, Athena, RDS, Lambda, Kinesis
  - **Hadoop** HDFS, Hive, Impala, Presto
  - **Stats and ML** pandas, scipy.stats, numpy, sklearn, lifelines, pymc3, ML-lib
- 

### Experience

#### Udemy *Senior Software Engineer, Data Platform* **June 2019 to Present**

- Developed mysql to s3 pipeline to process mysql binlogs through a kafka into a scala spark streaming application that provides distributed updates and deletes in apache hudi format on AWS s3.
- Used ansible and terraform to build and maintain production data infrastructure in AWS including multiple AWS EMR clusters that ran up to 880 cores and 7 TB of memory.
- Rotated in on-call schedule to ensure infrastructure was reliable and ~1K jobs passed on a daily basis.

#### Waymo *Senior Data Scientist* **June 2018 to June 2019**

- Designed and developed the python run feature extractor pipeline. Built on apache beam, flume, borg, python and protobuf, the framework provides users a simple design pattern to extract features[counts, histograms, rainfall matrix], from vehicle and sds log data, and then to scale over the whole fleet processing 100's of TB in minutes.
- Developed Metropolis Hastings algorithm in Go for sampling from a Weibull posterior with arbitrary priors.

- Developed Markov chain Monte Carlo python code base for accurately forecasting field failures in complex systems.
- Developed Reliability analytics data pipeline and dashboards for report automation.

**Mayfield Robotics** *Data Engineer, Consultant* **March 2018 to June 2018**

- Data Warehouse: Designed and implemented analytics data infrastructure using spark via AWS Glue to process robot logs and disparate data sources into AWS Athena optimized parquet files on S3.

**Tesla** *Software Engineer, Data Scientist, Manager* **2013 to 2018**

- Built and Maintained robust back end infrastructure on top of Docker and Ansible. My design made it easy to provision and manage a Spark cluster and various Micro-Services between two people while also providing statistical models and TB scale log analytics.
- Established an analytics workflow leveraging git version control, with jira integrations. Designed the ETL workflow using spark, airflow, jupyter and superset.
- Provided direction on proactive maintenance campaign and prognostics algorithm development using machine learning techniques: *random forest, logistic regression, physics of failure*.
- Established an extensive code base that provides tools to the organization for extracting, transforming, and analyzing field data at scale.
- Developed a modern approach to advanced warranty simulation in Python that can account for competing failure modes in a repairable system under varying use conditions.
- Developed statistical frame work for python: *Weibull analysis, Stress-Strength Convolution, Hypothesis testing, Best fit solver, generalized distribution framework, newton-raphson solver, ranking methods, mttf*

**Ingersoll Rand** *Reliability Engineer* **2011 to 2013**

**Medtronic INC.** *Product Performance Specialist* **2010 to 2011**

**Boeing Corporation** *Systems Engineer* **2008 to 2009**

---

**Education**

**Graduate Course Work (Reliability Engineering) 2012 to 2013** University of Maryland (online) College Park, Maryland *ENRE 602: Reliability Analysis ENRE 655: Advanced Methods in Reliability Modeling*

**Bachelors of Science in Aerospace Engineering 2004 to 2008** Iowa State  
University Ames, Iowa

---

### **Projects**

**Cronicle** is a git integrated workflow scheduler that provides a pull model for CI/CD and versioning on job execution.

### **Invited Talks**

**PHM Society 2015** automotive panel discussion

**ARS 2014** Big Data in Reliability: 1st Place
